

Data Analyst - Live Case Round

Aftershoot Pro - Monthly Usage & Churn Propensity

The Case

Background

Aftershoot Pro is a subscription product where active subscribers generate monthly usage logs. Each active month a user has appears as one row in the dataset. Users can create as many projects as they like, and within those projects, they can use any of three features - **Culling, Editing, or Retouching**.

The dataset

Each row represents one active month for one user, with the following fields:

- **user_id** - unique subscriber identifier
- **active_month** - the subscription-active calendar month
- **first_payment_date** - the date the user became a paying subscriber
- **total_projects** - number of unique projects created that month
- **culls** - number of projects with culling used
- **edits** - number of projects with editing used
- **retouches** - number of projects with retouching used

Each user has multiple rows, one per active month, until they churn. *A user who stops having an active-month entry from a given month onward can be treated as churned - though note that users may also reactivate later.*

Interview Format

The assessment is split into two parts.

Part 1: Pre-Interview Exploration (60 minutes)

We encourage you to spend this time exploring the data and thinking through the problem independently. There is no expectation of arriving at a complete solution or preparing a polished presentation. Instead, use this time to:

- Familiarise yourself with the dataset.
- Identify ambiguities and assumptions you would want to validate.
- Form hypotheses about subscriber behaviour and churn.

- Explore different aspects of user behaviour and feature usage that could help identify churn or predict churn propensity.
- Think about which metrics, behavioural patterns, or feature combinations are likely to be leading indicators versus lagging indicators of churn.
- Decide which analyses you believe are most valuable and prioritize what you would investigate first.
- Consider how you would define churn, handle reactivations, and segment users for retention.

You may write exploratory code during this time if you find it helpful, but the emphasis is on developing a structured approach rather than completing a full analysis.

Part 2: Live Interview (45 minutes)

During the interview, we'll discuss your thought process and work through the problem together.

Expect the session to be collaborative and interactive. We'll ask you to explain your reasoning, justify your assumptions, and adapt your approach as new information is introduced. You may be asked to perform live analysis or write code to validate hypotheses, explore trends, or investigate additional questions based on your findings.

We're not looking for a single "correct" answer. Instead, we're evaluating how you:

- Structure an ambiguous business problem.
- Prioritize hypotheses and analyses.
- Identify meaningful behavioural signals and features associated with churn propensity.
- Communicate findings, trade-offs, and limitations.
- Translate insights into actionable product recommendations.

The goal is to understand **how you think**, not how quickly you can produce charts or write code.
